

Free Oracle Disaster Recovery Strategy Assessment

As a special promotion Dataweave is offering a free half-day DR Assessment which is an abbreviated version of Dataweave's Oracle DR Strategy Review. During an interactive workshop we will review your availability, data security, recovery point and recovery time objectives and assess the effectiveness of your current DR precautions.

Dataweave can help you ensure that you have an effective DR strategy for your Oracle production databases and give you the confidence to know that when calamity strikes your systems will be up and running again within the target recovery time in your Service Level Agreement.

Reducing application / database / server down time and protecting data is crucial in today's 24/7 Business world. It is estimated that 1 out of 500 data centres will have a severe disaster each year. 43 percent of companies experiencing disasters never reopen, and 29 percent close within two years. Replacing hardware is easy compared to the challenges of recovering data and rapidly restoring to a specific known in point in time.

If your business critical applications depend on Oracle databases you have a wide variety of options to secure your data in the case of a system failure or site failure. There are Oracle solutions for synchronous and asynchronous hot standby, plus an option to improve performance of your main production system by utilising your DR standby server for live reporting, secure backup and the new Oracle solution for seamless

failover and production system upgrades without downtime. There are also infrastructure based options using disk mirroring and/or geo-clustering strategies.

Dataweave is an Oracle Certified Advantage Partner, the highest level of accreditation available. We have undertaken Disaster Recovery, Security Hardening and Database Architecture reviews for a number of high profile organisations.
