

# Database Health Check

How well is your database performing?

Have all the Critical Patches been applied?

Are your security policies best practice or is information at risk?

A Dataweave Health Check of your database and/or application server will answer these questions and give you peace of mind.

## What does it cover?

A health check needs to examine all aspects of the system: hardware, operating system, network, storage, database, application server and the application itself. All elements need to be considered in reviewing the health, version compatibility and optimum settings for your database environment.

## How Long Does it Take?

A Database Health Check will typically take 10 days: One week of data monitoring and collection followed by 3 days of analysis and documentation. The first day will consist of a system briefing, familiarisation with the documentation, online investigation and installation of monitoring software. After a week the collected data is extracted and analysed. The setup is compared with Oracle best practice and configuration advice for the specific hardware and OS environment.

## Deliverables

The Health Check Report will document the findings and Dataweave's recommendations, including an indication of the impact and effort to implement each one.

## Why Dataweave?

Dataweave is a specialist Oracle database and middleware consultancy. We have a team of highly experienced professionals with many years of experience in tuning and managing Oracle systems.

## How much does it Cost?

The Dataweave Health Check is \$4,500 per database or \$6,000 per database and application server environment. Please call for prices for multiple databases.
